

- Problem: MDF will literally ignite instantly and put glue fumes into the air and the writers of the paper are idiots for not using a different material.
- Easy solution: Use Macor
 - Macor price: \$448
 - I would be scared of chipping it and doing a bad job...
 - <https://www.mcmaster.com/products/macor-ceramic/>
 -
- Other materials that have above 500C active use are similarly expensive or very hard to machine...
- Alternative: Glass-Bonded Mica (Mycalex) (Has a lower operating temperature but doesn't instantly fail and will be fine for short bursts)
 - Mycalex Price: \$175.81
 - <https://www.mcmaster.com/products/macor-ceramic/>
 - Does create a fine powder – would need to hook up special apparatus to Carvera
 - https://www.youtube.com/watch?v=_iFvw3WZiss
- Calcium Silicate
 - Very inexpensive, fine powders but bad tolerance $\pm 0.1\text{mm}$ (WHICH IS ACTUALLY STANDARD – compares to aluminum)
